

Airline Passenger Analysis & Forecast (1949–1962)

Airline Passenger Analysis (1949–1962)

Insights Summary
Historical airline passenger traffic (1949–1960) shows a **clear upward trend**, indicating long-term growth in air travel demand. The forecast for 1961–1962 continues this trend, with **seasonal peaks in mid-year** and dips toward year-end. The forecast confidence interval (Upper & Lower CI) suggests that even under uncertainty, **passenger traffic remains consistently higher than previous years**. Overall, the data reflects strong post-war aviation growth and predictable seasonal patterns.

Airline Passenger Forecast (1961–1962)

Conclusion
The historical trend (1949–1960) confirms strong, consistent growth in airline passengers, driven by increasing adoption of air travel. The 1961–1962 forecast follows this trajectory, with expected seasonal highs in mid-year and dips at year-end. Overall, the data suggests stable demand growth, making resource planning and capacity expansion important priorities for the airline industry.

Business Recommendations
Plan for seasonal demand peaks (June–August) by allocating additional crew and aircraft.
Maintain stable capacity during forecast low periods (December–February).
Forecasted demand is **higher than historical levels**, indicating opportunities for:
Pricing optimization
Additional routes
Marketing during low months
Confidence intervals show **low uncertainty**, which supports reliable decision-making.
